                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting bisclosure; Page 57-60; 87pp; English.

To identify a cDNA from sugar beet which codes for citrate synthase, a cDNA from sugar beet which codes for citrate plaques of this cDNA bank were screened using radioactive DNA probes which comprise a mixture of Solanum tuberosum citrate synthase cDNA (T04199) and Nicotian tabacum citrate synthase cDNA (see T04201). One of the clones was sequenced. The nt. sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         121 pdhvyktidalpitahpmtqfctgvmalqtrsefqkayekgihkskfweptyedclslia 180

The aarA gene encodes the citrate synthase and is part of an acetic acid resistance operon comprising aarA, aarB and aarC.

The DNA can be used to prepare an acetic acid resistant strain of bacteria for use in acetic acid fermentation.

This sequence represents a Streptococcus methyl tetrahydroptercyltric on homology with an E. coli protein, is a methyl tetrahydroptercyltric glutamate-homocysteine methyltransferase, and is encoded by a DNA of the invention. The DNA sequences were isolated from S. pneumoniae strain of 100093 (NCIMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or T cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal proposation of pathogenesis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps 10;

Chaim 14. Pages 556-557: 1145pp. English or treat H. pylori polypeptide binding compounds.

Chaim 14. Pages 566-557: 1145pp. English or treat H. pylori life cilon of infection or to identify H. pylori plypeptide binding compounds.

Chaim and probes derived from it may be used for the identification of H. pylori life action. Nucleic complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies can be used to prevent the translation of H. pylori-specific antigens. The genomic sequence of and distribution of H. pylori-specific antigens. The generated complementary shearing the bacterial DNA. The sequences were analysed computer evaluation. To identify 11kely H. pylori antigens for defined by computer evaluation. To identify 11kely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                           New manualian vesicle membrane transport protein - and corresp.

DNA, vectors, transformed cells and antibodies, for diagnosis and transformed cells and antibodies, for diagnosis and transport of neurological disorders, e.g. Parkinson disease

Example 2: Page 114-115; 181pp; English.

The cDNA encoding the chromaffin granule amine transporter protein is useful in gene therapy and as a probe for detecting genomic sequences. The protein is used for screening cytotoxic compounds implicated in Parkinsons disease, diseases associated with activity of neurotoxins or psychiatric disorders and to identify compounds which selectively inhibit or activate its action. Antibodies raised detecting this protein are useful as immunoassay reagents for detecting the protein and as affinity reagents for purfice action.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           208 DSMSLIAQVPLVAAYVYRRMYKNGNT-IPKDDSLDYGANFAHM-LGFSSSD-MHELMKLY 264

Notice to the protein and the diagnosis of the protein and discretable to treat or prevent H. pylori infection and for diagnosis of H. pylori infection and for diagnosis of H. pylori infection and for diagnosis of H. pylori infection or clear H. pylori sequence is a H. pylori cytoplasmic protein involved in cofactor metabolism. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and acid sequences complementary to the DNA act as antisense sequences and acid sequences complementary to the DNA act as antisense sequences and adistribution of H. pylori minimunoassays to evaluate the abundance and distribution of H. pylori. Specific antigens. The genomic sequence of H. pylori (ATC 5679) was determined from overlapping contigs generated by mechanically shearing the bacternal DNA. The sequences were analysed for SPR of at least 180 nucleotides, and the predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                      membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli

Claim 1: Page 20-21; 26pp; Japanese.
This sequence is a rat CC chemokine receptor. The receptor can be used to screen for novel binding compounds and for preparation of antibodies or antiserum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     73 lfnlavsdlvflftlpfwidy-klkdnwvfgdamckllsgfyylglyseiffiilltidr 131

This is the amino acid sequence of the mouse laminin A chain. The primary object of the invention is to use laminin, laminin-derived protein fragments and/or laminin derived polypeptides as potent inhibitors of amyloid formation, deposition, accumulation and/or persistence in Alzheimer's disease and other amyloidoses. The laminin products (see W50088-99) may include mouse or human laminin A or Al chain, laminin Bl or B2 chain, laminin A2 chain (merosin), laminin G1 chain, the globular repeats of the laminin Al chain and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                07-DEC(1998 (first entry)

the beta-amyloid binding domain of the laminin A chain. A claimed method for treating an amyloid disease comprises administering a polypeptide having a conformational similarity to a fragment of a laminin protein. A method for diagnosing an amyloid disease laminin protein. A method for diagnosing an amyloid disease involves determining levels of laminin in a sample. Production of laminin or its fourth globular repeat in vivo provides a method for in vivo inhibition of beta-amyloid amyloidosis. The products

This sequence represents human MIP-1 alpha/RANTES receptor (macrophage inflammatory protein 1 alpha/regulated on activation, normal T cell expressed and secreted). The human MIP-1 alpha/RANTES receptor protein may be used in a method for the screening of human MIP-1 alpha/RANTES receptor receptor affinity compounds. The MIP-1 alpha/RANTES receptor coding sequence may be included in an expression vector, preferably pccR, and used to transform a CHO cell for use in the same method. The receptor protein can provide a preventive and treating agent for viral diseases, infectious diseases, tumours, allergy, diabetes, central diseases, hyperlipidaemia, hypercholesterolaemia, osteoporosis, digestive ulcers,
                                                                                                                                                     20-NOV-1997 (first entry)
Human MIP-lalpha/RANTES receptor protein.
Human MIP-1 alpha/RANTES receptor; osteoporosis; pCCR; digestive ulcer;

           This polypeptide comprises a claimed receptor for human macrophage inflammatory protein-1 alpha (MIP-1 alpha) and regulated upon a civation normal Texpressed and secreted (RANTES) protein. Also claimed are: a nucleic acid (see T90384) that encodes the receptor: a subsequence of the nucleic acid, having at least 12 contiguous nucleotides; a cell transformed or transfected with the nucleic acid; and purified MIP-1 alpha/RANTES receptor purpoperide. The products can be used for defecting the MIP-1 alpha/RANTES receptor or products can be used for defecting the MIP-1 alpha/RANTES in addition, the receptor can be expressed and used to assay for MIP-1alpha/RANTES in biological samples. The quantitation of MIP-1 alpha/RANTES is biological samples and used to assay for MIP-1alpha/RANTES is biological samples are useful in following the antiinflammatory effects of drugs and prospective usefulness of new antiinflammatory

prodn. of polypeptide(s) for stimulating immune system against HRV
                                                                   The viral proteins are used for stimulating a protective immune response and for blocking cellular receptors. Abs against them are useful for assay and purificn. of the corresp. antigen, and can also be used for the therapeutic and diagnostic applications. Sequence 2164 AA;
                                                                                                                                                                                                                                                                          5;

citrate (si)-synthase (EC 4.1.3.7) precursor, mitochondrial - Arabidopsis thaliana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                *#cross-references EMBL:X17528; NID:g11243; PID:e1188578; FID:g2652924
*#note the sequence from Fig. 2 is inconsistent with that from
Fig. 1 in having 47-Gly, 125-Trp, 141-Leu, 151-Ser,
185-Asn, 187-Asn, 191-Asn, 348-Leu, an additional Gly
after 89-Trp, an additional Val after 393-Cys and two
additional Arg after 228-Arg, in lacking 114-Leu and
residues 333 to 241
                                                                                                                                                                                                                                                                                                                                           #Journal Plant Mol. Biol. (1989) 13:411-418
#title isolation of a cDNA encoding mitochondrial citrate synthase from Arabidopsis thaliana.
